

Emerald Ash Borer is present in some trees on the BNAC property. This Asian beetle infests and kills ASH trees. We realize that many trees may be lost in the coming years. In response, we are putting efforts in to maintaining the health of other trees in the park such basswood, maple, oak, cottonwood and elder. One of our projects involves the trimming of wild grapevines. These vines can choke trees if not controlled. It is a yearly task that has been successful in saving many trees.
